Location	Baku	
Year	2010	

An experimental conceptual design for a ski resort with a hotel in Baku. It was implied that the complex would have two ski slope options. The first option is the classic one, where the main altitude surface is located on a special platform in which a hotel for visitors will be built. The ski slope building is closed by a solid wall on one side and fully glazed on the other, which allows for a stunning picturesque view.

The second option is a ski pipe closed in a ring. The complete design represents an unusual, angular, bizarre construction. Inside such a pipe, visitors will follow a completely different trajectory, as compared to the first option, which will allow them to hit the slope and return faster.
